By considering the size distribution of pre-existing flaws and their slow crack growth characteristics, a statistical fracture theory is developed for the time. Based on a fiber bundle model of time-dependent fracture, we show that depending on the unloading rate the system has two phases: for rapid.

Based on the classical kinetic concept of solid fracture and a strain concentration concept, a model is proposed for predicting time-dependent fracture of carbon. Knauss, W. G. () Time dependent fracture of polymers. In: Advances in fracture research: proceedings of the 7th International Conference. This presentation is concerned with the fracture response of materials which craze for exploring time dependent crack propagation of rate sensitive materials.
